AT&T and Honeywell Team Up on Connected Aircraft and Freight Solutions

AT&T and Honeywell are collaborating to deliver Internet of Things (IoT) technology to aircraft and freight solutions in countries across the globe, including Europe, North America, Latin America, Asia, Africa, and Australia.* AT&T's global connectivity and IoT solutions combined with Honeywell's technology offerings are helping companies make decisions and solve problems faster, improve reliability and boost operational efficiency.

"We have enjoyed a business relationship with Honeywell for many years. Our IoT solutions are helping them to drive digital transformation in their transportation products," said Joe Mosele, VP – IoT Solutions, Business Development at AT&T. "Honeywell understands the value of connecting assets across its enterprise. Not only is Honeywell using data insights collected from its products to improve its own operations, but it's also giving that technology to its customers to make informed decisions about their businesses."

AT&T's [IoT solutions](#) are connecting the following:

Connected Freight

A scalable IoT solution that tracks and monitors critical shipments while they are in transit. Sensor tags attached to assets, pallets, or individual packages not only provide location information, but also measure for shock and tilt, humidity, temperature, and pressure changes. Logistics providers access a dashboard to receive status alerts and can react quickly to incidents that occur during shipment to prevent damage and loss.

Connected Aircraft

The AT&T global network connects aircraft services while on the ground. Honeywell's GoDirect™ family provides operators, flight crews, and maintenance teams with critical information to manage their services and network. These improve fleet management, flight safety, passenger experience, maintenance, flight operations, aircraft turnaround time, and costs.

AT&T's Control Center with the AT&T global network helps Honeywell better scale its aircraft and freight solutions in the U.S. and abroad. Honeywell and its customers can manage IoT connected assets remotely in a highly secure environment and automate data usage to control costs.

AT&T brings everything together edge-to-edge – from end points to connectivity to the cloud – wrapped in security.
